Description

Technical Field

[0001] The present invention relates to tri- heterocyclic compounds of formula (I)

wherein all symbols are as hereinafter defined; which is useful as a pharmaceutical, and a pharmaceutical comprising them as an active ingredient.

Background

[0002] Corticotropin Releasing Factor (CRF) was a peptide comprising 41 amino acid residues and isolated from ovine hypothalamic in 1981. It was suggested that CRF was released from hypothalamic and controlled a secretion of adrenocorticotrophic hormone (ACTH) from hypophysis [Science, 218, 377-379(1982)].

[0003] A biological effect is begun from CRF binds to CRF receptor, which exists on membranous surface of ACTH producing cell in anterior pituitary. Two subtypes of CRF receptors have been identified, and each one of these is distributed in a different area of brain. For example, a lot of receptor 1 is distributed in hypophysis, hypothalamic, cerebral cortex and a lot of receptor 2 is distributed in septal of brain, hypothalamus nucleus paraventricularis. Besides, receptors are also distributed in peripheral organ, for example, heart, gastrointestinal, lung, adrenal medulla, spleen, liver, renal, glandula prostatica. Concretely, receptor 1 is existed in bowel or spleen, receptor 2 is existed in stomach and especially receptor 2 β is existed in heart and skeletal muscle.

[0004] ACTH, which is released by a stimulation of CRF, stimulates a secretion of cortisol from adrenal cortex, and relates to a systemic action for reproduction, growth, gastrointestinal function, inflammation, immune system, nervous system etc. Consequently, CRF is believed to plays a role as a regulator of these functions.

[0005] It was reported that excess CRF was secreted in brain of patient with depression and anxiety disorders [Science, 226, 1342-1343 (1984); Neuroscience and Behavioral Reviews, 22, 635-651 (1998); J. Endocrinol, 160, 1-12 (1999)].

[0006] Besides, a relation of CRF and various disorders was reported, for example, eating disorder [Science, 273, 1561-1564 (1996)], inflammation [Endocrinology, 137, 5747-5750 (1996)], irritable bowel syndrome [Am. J. Physiol, 253, G582-G586 (1987)], drug dependence [Psychopharmacology 137, 184-190 (1998)] and ischemia [Soc Neurosci Abstr(Nov 4-9, New Orleans), 807.5 (2000)].

[0007] On the other hand, CRF has an intimate involvement in stress. For example, administration of CRF to the brain elicited same behavior and endocrine response as an animal under stressful conditions [Nature, 297, 331 (1982)].

[0008] As above, a relationship of CRF and a disorder of central nerve system, neuropsychiatric disorder or a disorder of peripheral organ has been attracted attention.

[0009] Accordingly, an antagonism of CRF receptor is considered to be useful for a disease by abnormal secretion of CRF, for example, various diseases comprising stress-related disorders. For examples, it is believed to be useful for a prevention and / or treatment of depression, single episode depression, recurrent depression, postpartum depression, child abuse induced depression, anxiety, anxiety related disorders (e.g. panic disorder, particular phobia, fear of falling, social phobia, obsessive compulsive disorder), emotional disorder, bipolar disorder, posttraumatic stress disorder, peptic ulcer, diarrhea, constipation, irritable bowel syndrome, inflammatory bowel disease (ulcerative colitis, Crohn's disease), stress-induced gastrointestinal disturbance, nervous emesis, eating disorder (e.g. anorexia nervosa, bulimia nervosa), obesity, stress-induced sleep disorder, pain of muscular fiber induced sleep disorder, stress-induced immune suppression, stress-induced headache, stress-induced fever, stress-induced pain, post operative stress, rheumatoid arthritis, osteoarthritis, osteoporosis, psoriasis, thyroid dysfunction, uveitis, asthma, inappropriate anti-diarrhea hormone induced disorder, pain, inflammation, allergic disease, head injury, spinal cord injury, ischemic neuron injury, toxicity neuron injury, Cushing's disease, seizure, spasm, muscular spasm, epilepsy, ischemic disease, Parkinson's disease, Huntington disease, urinary incontinence, Alzheimer's disease, senile dementia of Alzheimer type, multi-

infarct dementia, amyotrophic lateral sclerosis, hypoglycemia, cardiovascular or heart-related disease (hypertension, tachycardia, congestive heart failure), drug addiction or alcohol dependence syndrome.

[0010] On the other hand, following compounds having an antagonism activity of CRF were known.

Pharmacological Activities

[0083] The compound of the present invention of formula (I) possesses CRF receptor antagonistic activity, for example, such an effect of the compound of the present invention was confirmed by following tests.

(1) Binding assay

[cell membrane preparation]

[0084] After the cell line expressing human CRF1 receptor (expressed cell line: CHO-K1 cells) was cultured to reached confluence, the cells were harvested with a scraper. Harvested cells were washed twice with PBS before being suspended in binding assay buffer (Tris-HCl (50 mM, pH 7.0), EDTA (2 mM, pH8.0), $MgCl_2$ (10 mM)) cooled by ice. Suspended cells were homogenized with a Downs-type homogenizer and subjected to centrifugation at 10,000g to collect the membrane fraction. The harvested cell membrane fraction was resuspended with a small quantity of the binding assay buffer, and further diluted with said buffer to 1 mg/mL. The membrane fraction thus obtained was used for binding assay.

[binding assay]

[0085] Fifty μ L of [125 I] h/r CRF prepared to 0.5 nM with binding assay buffer was added to siliconized 1.5 mL tubes 1 μ L of compounds diluted in appropriate multiples, DMSO (for total binding use), or h/r CRF solution (100 μ M, for the non-specific binding use), respectively, added to the tubes. Samples of 50 μ L each of the membrane fraction preparation were added to the tubes to initiate the reaction (final concentration of [125 I] h/r CRF: 0.25 nM), then the mixtures were incubated for 2 hours at room temperature. After termination of the reaction, tubes were subjected to centrifugation at 15,000g to collect the membrane fraction. The supernatant was discarded, and the pellet was rinsed twice with cooled PBS (-) containing 0.01% Triton X-100. Radioactivity values of the respective tubes were measured with a γ -counter.

[0086] The specific binding was derived by subtracting the non-specific binding value from the each binding value.

[0087] The results indicated that these invented compounds exhibited potent affinity on CRF1 receptor ($IC_{50} < 1 \mu M$).

(2) A measurement of an antianxiety activity using the elevated plus-maze

[0088] Two arms (open and closed) of equal width and length (50 cm \times 10 cm), which crossed at a right angle to form a plus maze, were elevated to a height 50 cm above the ground level. The closed arm had a wall of 40 cm. Lighting on both ends of the open arm was maintained at constant illumination. Thirty minutes after administration of various doses of test-compounds (5 mL/kg), male SD rats were placed in the center of the plus maze. The time spent(s) in the open arms and the number of entries into the respective arms were measured within a 5 minutes period. The investigation personnel for measuring the indexes positioned at a fixed location during the course of the experiment.

[0089] The result was shown in figure 1 and 2. These figures indicated that the time spent in the open arms was extend significantly and the number of entries into the open arms was increased significantly by an administration of 3 and 10 mg/kg of the compound of Example 2(78) of the present invention, that is it was shown an antianxiety effect.

(Subject of search)

Claim 1 involves a great number of compounds in its scope. However, it is recognized that only small part of the claimed compounds are exclusively supported by the description under the provision of Article 6 of the PCT and disclosed therein under the provision of Article 5 of the PCT.

Therefore, the search has been practiced on the part supported by the description and disclosed therein, namely, the compounds of the general formula (I) wherein A is a 5-membered or 6-membered carbon ring or heterocycle; the fused ring moiety other than A has a pyrazolo[1,5-a]pyrimidine structure, a pyrrolo[1,2-a]pyrimidine structure or a pyrrolo[2,3-b]pyrimidine structure; and R₃ is a phenyl group or a pyridyl group.

The same applies to claims 2 to 23.
